		<p><b><u>Important Instructions to examiners:</u></b></p> <p>1) The answers should be examined by key words and not as word-to-word as given in the model answer scheme.</p> <p>2) The model answer and the answer written by candidate may vary but the examiner may try to assess the understanding level of the candidate.</p> <p>3) The language errors such as grammatical, spelling errors should not be given more importance <u>(Not applicable for subject English and Communication Skills)</u>.</p> <p>4) While assessing figures, examiner may give credit for principal components indicated in the figure. The figures drawn by candidate and model answer may vary. The examiner may give credit for any equivalent figure drawn.</p> <p>5) Credits may be given step wise for numerical problems. In some cases, the assumed constant values may vary and there may be some difference in the candidate's answers and model answer.</p> <p>6) In case of some questions credit may be given by judgement on part of examiner of relevant answer based on candidate's understanding.</p> <p>7) For programming language papers, credit may be given to any other program based on equivalent concept.</p>

1.	d)	<p><b>State two assumptions of Arrhenius theory of ionization.</b></p> <p>1. The molecules of an electrolyte when dissolved in water split up into two kinds of charged particles, positively charged particle known as cation, negatively charged particle known as anion.</p> <p>2. Cations are metallic radicals obtained by loss of electrons from metallic atoms. Anions are non-metallic radicals obtained by gain of electrons from non-metallic atoms or groups of non-metals.</p> <p>3. In solution, total numbers of cations (positive charges) is equal to the total number of anions (negative charges) &amp; hence the solution as a whole is electrically neutral.</p> <p>4. The cations &amp; anions present in the solution reunite together forming the original electrovalent compound. Therefore it is reversible type of process.</p> <p>e.g <math>\text{NaCl} \rightleftharpoons \text{Na}^+ + \text{Cl}^-</math></p> <p>5. The number of positive or negative charges on the cations or anions corresponds to the valency of the element or radical from which the ion is derived.</p>	1 mark each	2
	e)	<p><b>Name the four factors which affect degree of ionization.</b></p> <p>Factors affecting degree of ionization:-</p> <ol style="list-style-type: none"><li>1. Nature of Solute</li><li>2. Nature of Solvent</li><li>3. Concentration of the solution</li><li>4. Temperature</li></ol>	$\frac{1}{2}$ mark each	2
	f)	<p><b>State Faraday's Second Law of Electrolysis.</b></p> <p><b>Faraday's Second Law of Electrolysis:</b> This law states that, when the same quantity of electricity is passed through the different electrolyte solutions which are connected in series, the amount of the substance deposited or liberated at the electrodes are directly proportional to their chemical equivalents.</p>	2	2
	g)	<p><b>Why blue colour of copper sulphate solution turns to colourless after its electrolysis using platinum electrodes?</b></p> <p>The platinum electrodes are inert. Hence does not dissolve into the solution.</p>		2

**Summer-2016 Examination**

**Page No: 4/12**

Que. No.	Sub. Que.	Model Answer	Marks	Total Marks
1.		The Cu <sup>++</sup> ions (blue in colour) present in the solution are discharged on the surface of cathode & OH <sup>-</sup> are discharged on the surface of anode while H <sup>+</sup> and SO <sub>4</sub> <sup>2-</sup> ions remains in the solution. As a result of this electrolysis, blue coloured CuSO <sub>4</sub> solution is slowly converted into colorless H <sub>2</sub> SO <sub>4</sub> solution.	2	
	h)	<b>Define: i) Ore ii) Gangue</b>		2
		<b>i) Ore:</b> The mineral from which the metal is conveniently and economically extracted is known as <b>ore</b> .	1	
		<b>ii) Gangue :-</b> Ores obtained from earth's crust are always associated with impurities like sand, clay, rocks etc. & these <b>unwanted impurities associated with the ores</b> are known as 'gangue' or 'matrix'.	1	
	i)	<b>Write the two purposes of making alloys with one example of each.</b>		2
		<b>The purposes of making an alloy with example:</b>		
		<b>1. Improve hardness of metal</b> e.g. Pure gold & silver are soft. Hence they are hardened by the addition of a small amount of copper in them.		
		<b>2. Lower the melting point</b> e.g. Wood's metal is an alloy of Bi, Pb, Sn, Cd. It has the M.P. 71 <sup>0</sup> C which is much lower than those of its constituents.		
		<b>3. Increase the tensile strength</b> e.g. The addition of 1% carbon increase the tensile strength of pure iron by about 10 times.		
		<b>4. Increase corrosion resistance</b> e.g. Pure iron is corroded fastly but its alloy stainless steel resist corrosion.		
		<b>5. To get good casting</b> e.g. Bronze (an alloy of Cu & Zn) and Duralumin possess good casting property.		
		<b>6. Modify colour</b> e.g. Brass is an alloy of copper (red) and zinc (silvery white) and is yellow in colour.		
		<b>7. Reduce malleability &amp; ductility</b> e.g. a small amount of copper is added to gold and silver to reduce their malleability and ductility.		
		<b>8. Modify chemical activity</b> e.g. Sodium is highly reactive element, but when it is alloyed with mercury to form an alloy called sodium- amalgam , it becomes less reactive.		
		<b>(consider relevant examples)</b>	1 Mark each
